

Audit Report

Psychiatric Medicine

Website: <https://www.psychiatricmedicine.com>

Audit Type: Technical SEO, On-Page SEO & Performance Review

Date: February 2026

Executive Summary

Website Overview

This audit reviews the overall performance, technical SEO setup, and on-page optimization of psychiatricmedicine.com. The purpose of this analysis is to identify the main factors affecting website speed, search visibility, and user experience, along with practical recommendations for improvement.

The website has a solid foundation; however, several technical and content-related improvements can significantly enhance loading speed, mobile usability, and organic search performance.

Key Findings

During the audit, several important issues were identified:

- Slow loading of key page elements affecting Core Web Vitals
- Heavy JavaScript impacting page responsiveness
- Render-blocking resources delaying content display
- Opportunities to improve title tags and meta descriptions
- Heading structure and content depth require optimization
- Mobile performance needs improvement

These factors directly influence both search rankings and user engagement.

Overall Audit Status

Core Web Vitals — Needs Improvement (High Priority)
Technical SEO — Some Issues Found (High Priority)
On-Page SEO — Optimization Needed (Medium Priority)
Content Quality — Can Be Expanded (Medium Priority)
Mobile Experience — Needs Improvement (High Priority)

Priority Action Areas

1. Improve Largest Contentful Paint (LCP)
 2. Reduce JavaScript execution time
 3. Fix render-blocking resources
 4. Optimize page titles and meta descriptions
 5. Improve internal linking and content clarity
 6. Enhance mobile usability
-

Expected Impact

Implementing these improvements is expected to result in faster loading speeds, improved Core Web Vitals performance, better search visibility, enhanced mobile experience, and increased user engagement.

The website does not require a redesign. Most improvements can be achieved through structured technical and on-page optimization.

Website Performance Analysis

Overall Performance (Desktop & Mobile)

The website performance score indicates that optimization is required, especially for mobile users. Google primarily evaluates mobile performance, making speed optimization essential for SEO success.

Performance limitations are mainly caused by slow content rendering, heavy scripts, and blocking resources.

Largest Contentful Paint (LCP)

The main visible content takes longer than recommended to load, which affects user perception of speed and search engine rankings.

Recommendations

- Preload important images
- Convert images to modern formats such as WebP
- Improve server response time
- Avoid lazy loading above-the-fold content

Target: LCP below 2.5 seconds.

Total Blocking Time & JavaScript Optimization

High JavaScript execution time delays page interactivity and impacts user experience, particularly on mobile devices.

Recommendations

- Remove unused JavaScript
 - Minify and defer scripts
 - Reduce third-party integrations
 - Split large JavaScript files
-

Render-Blocking Resources & Image Optimization

Certain CSS and JavaScript files delay page rendering. Additionally, unoptimized images increase loading time.

Recommendations

- Defer non-critical JavaScript
 - Inline critical CSS
 - Serve properly sized images
 - Enable compression and caching
-

Technical SEO Analysis

Page Title Optimization

Page titles should clearly reflect page intent and include relevant keywords to improve visibility in search results.

Recommendations

- Keep titles between 50–60 characters
 - Place primary keywords near the beginning
 - Ensure every page has a unique title
-

Meta Description Optimization

Meta descriptions help improve click-through rates by summarizing page content for search users.

Recommendations

- Maintain length between 150–160 characters
 - Use natural keywords
 - Include clear value-driven messaging
-

Heading Structure (H1–H3)

Proper heading hierarchy improves readability and helps search engines understand page structure.

Recommendations

- Use one H1 per page
 - Maintain logical hierarchy (H1 → H2 → H3)
 - Avoid skipped heading levels
-

Image Alt Attribute Optimization

Alt attributes improve accessibility and allow search engines to understand image content.

Recommendations

- Add descriptive alt text to all images
 - Describe images naturally
 - Avoid keyword stuffing
-

On-Page SEO & Content Analysis

Content Depth & Keyword Relevance

Expanding content helps establish topical authority and improves keyword coverage.

Recommendations

- Expand service descriptions
 - Add FAQs related to services
 - Include benefits and process explanations
 - Strengthen internal linking
-

Internal Linking Structure

A strong internal linking strategy improves crawlability and distributes page authority across the website.

Recommendations

- Link related pages together
 - Use descriptive anchor text
 - Ensure important pages are reachable within three clicks
-

Mobile Usability Optimization

Mobile optimization is essential as Google uses mobile-first indexing.

Recommendations

- Reduce unnecessary page elements
 - Optimize fonts and spacing
 - Avoid heavy animations
 - Improve responsive layout behaviour
-

Priority Fix Roadmap

High Priority

- Improve Core Web Vitals performance
- Reduce JavaScript execution
- Optimize mobile speed

Medium Priority

- Improve metadata optimization
- Fix heading structure
- Strengthen internal linking

Low Priority

- Content expansion and ongoing SEO improvements
-

Estimated SEO Impact

Applying the recommended optimizations is expected to improve website speed, enhance user experience, strengthen search visibility, and increase engagement metrics over time.

Performance and on-page SEO improvements typically lead to better rankings and improved user retention.

Conclusion

The website has a strong base but requires structured technical and on-page improvements to reach optimal performance standards.

By prioritizing Core Web Vitals, improving metadata structure, and expanding content quality, the website can achieve measurable gains in both user experience and organic search performance without requiring a full redesign.
